Plants grow bigger and more quickly when they can easily penetrate soil space. When you have compacted soil or soil with crusting, microbial activity is inhibited or stopped. **Pervaide** is a non ionic soil penetrant with both a chemically and biologically active element. Chemical activity lowers water surface tension to allows water and air to move into smaller pore spaces. Biologically, **Pervaide** also contains **AgCor**, to activate the microbiology of the soil and improve soil structure.

Most soil penetrants are only chemically activated, using ingredients that can harm the soil. **Pervaide** uses high quality surfactant to ensure the soil biology is helped and not hurt.

### **Benefits:**

- Reduce water surface tension for better water penetration
- Opens pore space in the soil
- Includes the biological package of **AgCor**

**Pervaide** 's biological ingredient improves the water holding capacity of the soil for reduced water stress and greater drought resistance.

Soil treated with **Pervaide** has:

**increased moisture retention**  
**Less crusting and soil compaction**  
**Improved soil aeration**  
**Better soil structure**  
**Increased microbial activity**
