Enhance

Available nutrients are *crucial to a plant* while it is fruiting or recovering from stress. **Enhance** is A highly effective way to deliver essential nutrients that are *immediately* taken into the plant through the cell wall.

For most crops, the best application time is when the plant is leaving the vegetative state and entering the reproductive state. Applying **Enhance** at these critical times provides the greatest possibility for increased yield.

Timing is Everything!!

The number one reason foliar fertilizers don't provide expected results is **poor timing**. Ag Concepts has commissioned dozens of tests to find the best time for effective foliar fertilizer. Consistently, the transition from the vegetative state to the reproductive state has shown to be a very effective time for application.

The number two reason, poor formulation! **Enhance** provides nutrients that are preferred during fruiting (like ammonia nitrogen) and are immediately available (orthophosphate and chelated micronutrients). Enhance is formulated as a 'complete package' that includes all essential ingredients in the proper form for the greatest foliar response without the need for costly micronutrient additives

Enhance Benefits:

- Provides immediate feeding during critical growth stages
- Provides excellent damage control/recovery after stress situations
- Includes humic acid and kelp extract allowing nutrients to enter and translocate in the plant
- Provides nutrients to your plant that may otherwise not be available
- Encourages root development
- Compatible with most pesticides
- Can be applied with glyphosate
