Ag Concepts® SuperHume®

Ag Concepts Super Hume is different than any other 6% humic acid on the market. Our **S-H 7 Process** is a unique and complex process of leonardite preparation, extraction and filtration.

Most humic acids use a single step process that leads to a cheap and simple product. The **SH-7 Process** used with **Ag Concepts Super Hume** *allows it to be applied cleanly.*

Additionally, **Super Hume** includes Kelp extract, providing trace minerals, chelating agents and naturally occurring growth-promoting substances to the plant in a naturally balanced form. The kelp aids the roots and the plant to take advantage of the improved soil condition.

Ag Concepts developed a unique multi-extraction process that starts with the finest (North Dakota) leonardite available. Our unique process adds additional preparation, extraction and filtration steps resulting in the highest quality humic acid available. Our process ensures fallout is taken care of at our plant and not in your spray lines where it can *cost you dearly*

Benefits of Ag Concepts Super Hume:

- **Improves soil structure, aeration, water movement and holding capacity**
- **Increased ability of nutrients moving in the soil**
- **Complexing/chelating agents (humic, organic and amino acids)**
- **Breaks ionic bonds of iron/calcium phosphate making iron, calcium & phosphate available**
- **Increases cell permeability**
